Solutions for airports
automatic door systems from record
record – automatic door systems

Automatic doors play a particularly important role at airports. In passenger areas and where there are high levels of pedestrian flow, record products provide you with enhanced security and safety, significantly improved convenience and most importantly, high standards of reliability, which has always been a record priority.

Security and safety

Our range of products has been developed to fulfill the high security and safety requirements of international airports. We can provide:

- Escape and rescue route security
- Fire and smoke-protection doors
- Security doors and interlocks to control personal access
- Door systems for access in one direction only
- Burglar-resistant security doors with multi-point locking
- record ADM door management systems to control and monitor doors, can also be integrated into existing building control systems

Convenience

- For passengers: thanks to automatic opening and closing of doors, complete freedom of movement is guaranteed at all times.
- For personnel: restricted areas can be accessed without delay; transporting baggage trolleys, luggage etc. is made easier.
- For the operating company: central monitoring and control of pedestrian traffic to and from departure and arrivals halls, and the flow of people in other airport buildings. Any operational malfunction triggers an alarm message that is immediately dispatched to central control.

Reliability

The foundation of our success has been our own R&D department, which we have been actively managing at our headquarters in Switzerland since 1953. As a global player, we distribute our products all over the world; we have branches and representative offices in over 50 countries.

When designing and manufacturing our products, we pay particular attention to ensuring their exceptionally long life and unrestricted functionality. To install them, we employ thoroughly trained service technicians who attend training courses on an ongoing basis. Our technical staff support you right from the planning stage. To provide you with complete solutions, inhouse record service technicians can carry out service and maintenance for you. Their highly detailed knowledge of the design and construction of products ensures the longevity and smooth operation of your installation for many years to come.

Our products are ISO 9001:2008 certified and also comply with all relevant international norms and standards.
Public areas

record provides the right solution for all airport areas:

Airport entrances and exits

- **Pedestrian walkways**: automatic sliding doors, round and curved sliding doors, swing doors, folding doors, revolving doors, door systems for controlled access in one direction, and security interlocks
- **Vehicle entrances**: rapid shutter doors

Passenger areas

The technology used in record doors complies with all safety standards required for emergency exits.

- Automatic sliding doors, redundant or with emergency breakout facility. In emergencies, door leaves and side screens can be removed and swung through 90° to maximise access.
- Automatic round and curved sliding doors
- Automatic revolving doors

Personnel areas

For personnel entrances, record automatic doors can be operated using standard access control systems. The following specially designed doors enable security of the highest level at access points:

- Security interlocks with video monitoring for single access only, empty room surveillance and personal identification at the entrance or authentication inside the interlock
- Security interlocks with automatic sliding or swing doors

Check-in and checkout areas; arrivals hall

Automatic sliding doors made of glass can also function to divide an area into zones inside terminals, and thus also ease navigation for passengers checking in or out.

In arrivals halls, automatic pivoting doors, swivelling doors or turnstile security interlocks can be installed to divide up a variety of areas into zones e.g. passenger security check areas, info desks, etc.

Sanitary area

Automatic sliding or folding doors enable higher standards of hygiene and convenience in sanitary areas such as toilets, nappy changing areas and showers. People appreciate the hands-free convenience of automatic doors.

Enabling connections with other means of transport

Automatic doors enhance the safety and convenience of both passengers and staff, and enable other means of transport to be more easily reached (bus station, underground and over ground railways).
Restricted areas

Control of persons
Parallel to passport control, automatic doors enable authorised personnel and goods access to restricted areas with virtually no delay. Standard access control systems enable authorisation by controlling automatic doors, and denying unauthorised people general access.

Shops in the duty-free area
Generally, shops in duty-free areas can easily be retro-fitted with record automatic door systems. As a key design feature, large areas of glass lend a high degree of transparency to zones, creating a luxurious appearance. The wide range of colours and finishes helps to lend a special touch to individual shops.

Should your security requirements after closing demand it, we recommend the SAFECORD burglary-resistant automatic sliding door. Equipped with a reinforced frame, laminated glass and multipoint locking, it provides exceptionally good protection against violent attempts to gain access to your premises.

Cafés / bars / restaurants
Among other things, prompt service is an essential requirement at airport eateries. Our rapid acting, compact folding doors can be found in many restaurants, functioning as the perfect barrier between the kitchen and dining areas. Here, you can of course also rely on our whisper-quiet 1 or 2 leaf automatic sliding doors at peak times.

First and business class lounges
Automatic doors give your entrance the exclusive look. Automatic door systems can be designed as an attractive feature of your corporate identity, or combined with access control systems to enhance their functionality. By installing a record automatic door system, you immediately identify yourself as an attentive host.
Security areas before departure and after arrival

The FlipFlow range from record automatically regulates the flow of people at airports and other areas with heightened security requirements. This one-way access system is usually set up with two barriers positioned in front of one another, and passed in one direction only. FlipFlows were designed by record to prevent the unauthorised crossing of person or persons from a public area to a restricted one. Any attempt to pass FlipFlows in the opposite direction is detected by an intelligent sensor system, triggering an alarm, and closing and locking the doors and barriers to prevent the person returning.

Areas of application
To effectively divide areas with high security requirements from public areas, e.g. airside from landside or from the transition area to the secure zone.

Uses and advantages
→ Suitable for the controlled flow of persons in high security environments
→ Compact, transparent design, also suitable for disabled persons

Options
FlipFlow TWIN BASIC / TWIN INTERLOCK (for high security)
→ Acts as a barrier between air and land zones
→ Can be extended with high performance modules
→ High performance security interlock function effectively prevents objects being thrown or passed through the interlock

FlipFlow SINGLE (for discrete security)
→ Acts as a barrier between two zones inside the airport
→ Security personnel are aside
→ Optional volumetric monitoring of static objects

FlipFlow WIDE (for enhanced convenience)
→ Suitable for customs exits
→ Security personnel in the immediate vicinity
→ For less critical security requirements
Security areas before departure and after arriving

Automatic smoke and fire protection doors
Should fire or smoke develop, record’s smoke protection sliding doors close reliably. The door is sealed with vertical bars at the sides and middle, and at the top and bottom of the door, seals automatically emerge. The passage of smoke is prevented for long enough to enable person or persons to be rescued without the need for breathing apparatus.

The record fire protection door resists the passage of fire and heat for at least 30 minutes. It is also available with integrated escape route doors.

Access to the planes (finger dock)
It is possible to install an automatic folding door to serve as an independent access point in passenger boarding bridges. This opens only when a gangway or air bridge has securely docked with it, and serves to enable bulky goods to be loaded on board, e.g. items that cannot be taken into the cabin like child’s buggies, wheelchairs etc.

Hangar, luggage sorting and claim area
Rapid acting shutter doors from record guarantee a smooth flow of traffic and also function as an excellent thermal barrier. Shutters comply with all customs’ regulations relevant to the luggage or freight area.
