Children’ s Clinic Erlangen

Case Study

The children’s’ clinic at the University Hospital of Erlangen treats pre-mature and newborn babies, children and teens of all ages. To ensure optimal care, depending on the medical condition and age, it has various departments and clinics staffed by experienced paediatricians, equipped with modern diagnostic and therapeutic tools and techniques. They work closely with highly qualified nurses, physiotherapists and educators for the health of its young patients.

Also playing a part in the patients’ recovery, the hospital features several dozen record CLEAN K1-A hermetically sealing automatic doors. The doors stand out with their large glass surfaces, which flood the building and fill the hallways with natural light. Blinds that close at the touch of a button are fitted to the glazed areas to create completely private zones.
